

# ASSET RESILIENCE SOLUTIONS

## **JBAR® CONTAINMENT & FLOOD MITIGATION SYSTEMS**

Providing a permanent solution to stopping flood water in its tracks and can help prevent spills from entering surrounding ground and watercourses.

JBAR® is a patented system designed to protect key assets from flooding and to contain oil spills. Available in various lengths, heights and shape configurations, JBAR® is a modular system that can be installed at most sites, whatever their size or location. It includes an integrated sump which can withstand flood waters, whilst ensuring any oil spill is contained within the bund. JBAR® can be fixed to an existing concrete slab, or can be self supporting. Combined with our protective coatings, JBAR® offers total defence against water and chemicals.

## ADALLINE® 400 PROTECTIVE COATING

Specially designed as a barrier to hydrocarbons, water and chemicals, Adalline® 400 is the class-leading asset protective coating, ideal for storage tanks, roofs, asbestos encapsulation, pipelines, brickwork and steel structures.

Adalline® 400 has been developed by Adler & Allan and is hydrocarbon resistant, gives structural integrity to any surface, drying quickly, providing a chemical barrier and rendering assets waterproof. Adalline® 400 withstands expansion, contraction and a wide range of temperatures. It is a secure, low maintenance lining that gives you peace of mind against flooding, and reduces the cost, time and potential environmental impact involved in any oil spill clean-up.

When it comes to installations, our specialists will work with local operational teams to minimise time on site and will take care of every stage; from site inspection and asset assessment to design and specification; from Risk Assessment and Health & Safety requirements to booking our teams in to fit in with your existing schedule of works.

And our 10 year warranty means you can be assured that assets lined with Adalline® 400 are protected for years to come.
